Recruitment 2014

For Backend web development

The participants will have to submit a web based registration application using PHP and MySql at the server end and HTML and CSS at the client's end. The application will be collecting data for different fields and will be storing the same in the database. The application should have following characteristics

1. The data should be validated at client and server side both

2. Application should be secure from common hacking attacks

3. It should be user-friendly and UI should be self explanatory

4. It should respond properly with error messages when wrong or false data entered

In the second phase of the application there should be login form which should allow the login of the users using the data stored through the sign-up form

The fields that are to be used are:

- Unique user id

- Name

- Password (min 8 char)

- Gender

- Contact number

- Email address

- City

- state
